Paciente en Centro de la Atención

Australian Healthcare and Hospital Association:

Case study

Adopting a VBHC approach in providing radiation therapy to adolescent and young adults

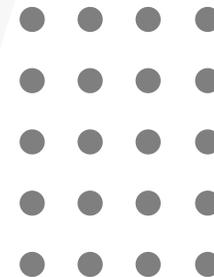

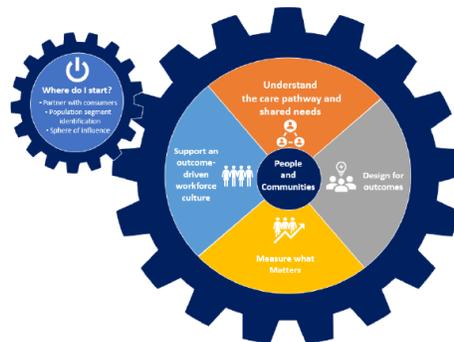

While the health system reorients to incentivise and support person-centred and sustainable care that focuses on outcomes over activity, and value over volume, health services are already demonstrating such shifts.

This case study was developed in collaboration with the Allied Health Professions' Office of Queensland (AHPOQ) as part of the Queensland Health Allied Health Framework for Value-Based Health Care (visually

Figure 1

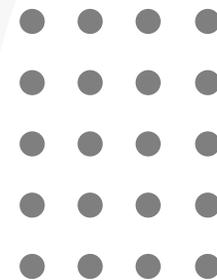

represented in figure 1). It has

been presented to demonstrate how a shift towards Value-Based Health Care (VBHC) was achieved

Maternal and neonatal mortality rates in many low- and middle-income countries (LMICs) are still far above the targets of the United Nations Sustainable Development Goal 3. Value-based healthcare (VBHC) has the potential to outperform traditional supply-driven approaches in changing this dismal situation, and significantly improve maternal, neonatal and child health (MNCH) outcomes. We developed a theory of change and used a

ABSTRACT

Although Value-Based Health Care (VBHC) is widely debated and cited, there are few empirical studies focused on how its concepts are understood and applied in real-world contexts. This comparative case study of two prominent adopters in Brazil and Sweden, situated at either end of the spectrum in terms of contextual prerequisites, provides insights into the complex interactions involved in the adoption of value-based strategies. We found that the adoption of VBHC emphasized either health outcomes or costs – not both as suggested by the value equation. This may be linked to broader health system and societal contexts. Implementation can generate tensions with traditional business models, suggesting that providers should first analyze how these strategies align with their internal context. Adoption by a single provider organization is challenging, if not impossible. An

Collaborative Working Reduces Overnight Stays For Parotid Surgeries In Value Based Procurement Pilot

5 August 2021

“ I was impressed with the support in implementing the new product and technique and looking at the full patient journey. The support provided by Baxter helped ensure all aspects of the patients journey were mapped and helped highlight areas of focus such as meeting patient’s expectations for day case surgery prior to surgery.

Navin Mani, Consultant Head and Neck Surgeon, Manchester NHS Foundation Trust

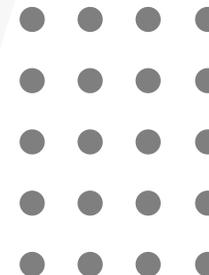

The Challenge

Manchester University NHS Foundation Trust is an NHS Acute Foundation Trust which operates 10 hospitals throughout Greater Manchester. It is the largest NHS trust in the United Kingdom, with an income of £1.6 billion and 21,945 staff.

The trust processes 93 parotid surgery cases per annum. A parotidectomy is the surgical removal of part or all of the parotid gland. The operation is performed under general anaesthetic. At the end of the operation the surgeon places a drain (plastic tube) through the skin in order to prevent any blood clot collecting under the skin.

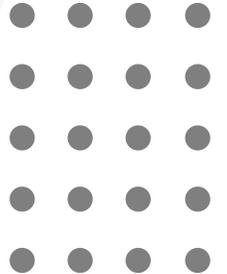

Patients spend on average 2.5 nights in hospital. Working with the clinical and procurement teams at Manchester NHS FT, Baxter Healthcare successfully

Observaciones Finales

- Existen **múltiples ejemplos** a nivel mundial sobre la implementación de acciones de SBV
- La implementación de SBV ha mostrado **mejores resultados en acciones específicas** que en intervenciones generales.
- El nivel de desarrollo de un sistema de salud o el **tamaño de la economía NO han sido barreras** para la implementación de acciones de SBV
- La **documentación y difusión de las acciones** que se implementen en nuestro país serán un catalizador para acelerar nuevas experiencias.

Muchas Gracias
